- ❖ Searches Notes® Mail & Archives, Applications, Mail Journals, Chats, Domain Indexes and IBM Quickr™.

- ❖ Searches File Systems & Chats, server-based or locally.

- ❖ Includes Discovery/Compliance Search, with customisable processing and export options.

- ❖ Configurable, re-searchable, re-sortable, exportable results.

The FT Search Manager is a fast, multi-threaded Notes & Web search tool that allows users to search Notes databases, Chats or File Systems simultaneously. The Search database can be installed on a server, and/or used locally.

This provides easy navigation through the vast amounts of data that can accumulate in a Notes environment over time.

You can search any Notes/Domino database, including Mail, Archives, Journals, Chats, Websites, Custom Notes Applications, Document Repositories, Discussions, Domain Indexes and Quickr. The databases being searched can be anywhere. You can search using the Notes Client, iNotes, Browser, Tablet, Smartphone or Web Service.

You can also search Server-based or local File Systems (doc, docx, xls, xlsx, ppt, pptx, vsd, pdf, odt, odp, ods, txt, htm and html) at the same time as Notes sources.

Power Users can perform Discovery/Compliance searches across thousands of databases at the same time, then select/process results according to your own requirements, e.g. copy selected results to another database, or export results to HTML, PDF or PST.

Users can start searches from the Notes Client, Mail File, Search database, or any other database, using Integrated Mail functionality, Actions, Toolbar Icons, URLs, Frames/iFrames, Web Services or Dialogboxes.
